1. Group Theory

1.1 Groups and subgroups

Definition 1.1.1 — direct product. Let $(G, *)$ and (H, \circ) be groups, then we may form a new group structure on $G \times H$ with group operation given by

$$(g, h) \star (g', h') = (g * g', h \circ h')$$

This is called the **direct product** of G and H.

1.1.1 Important Examples of Groups

Definition 1.1.2 — Dihedral groups 二面体群.

D_{2n} = symmetric group of a regular n-gon

It can be rewritten as

$$D_{2n} = \langle r, s | r^n = 1, s^2 = 1, rsr = s^{-1} \rangle$$

Definition 1.1.3 — Permutation Groups. Let Ω be a set. The set

$$S_\Omega = \{\text{bijections } \sigma : \Omega \xrightarrow{\sim} \Omega\}$$

admits a group structure:

- the group operation is composition
- the identity element is *id*
- the inverse of the element σ is the inverse map.

This S_Ω is called the symmetry group or the permutation group of Ω . When $\Omega = \{1, 2, \dots, n\}$, we write S_n instead.

Definition 1.1.4 — cyclic groups. A group H is called cyclic if it can be generated by one element x , i.e.

$$H = \langle x \rangle$$

Lemma 1.1.1 There are 2 kinds of cyclic groups up to isomorphism.

- (1) $H \cong \mathbf{Z}_n$
- (2) $H \cong \mathbf{Z}$

Definition 1.1.5 — The quaternion group.

$$Q_8 = \{1, -1, i, -i, j, -j, k, -k\}$$

1.2 cosets, Lagrange theorem, quotient groups

1.2.1 Conjugation, normal subgroups, and quotient groups.

Definition 1.2.1 — conjugate. Let $a, g \in G$, then gag^{-1} is called the **conjugate of a by g** .

Definition 1.2.2 — 定义-命题. If H is a subgroup of G and $g \in G$, then $gHg^{-1} := \{ghg^{-1} | h \in H\}$ is a subgroup, called the **conjugate of H by g**

Proof. We just need to verify that $\forall a, b \in H$, $gag^{-1} \cdot (gbg^{-1})^{-1} \in gHg^{-1}$. ■

Definition 1.2.3 — normal subgroup. If $H \trianglelefteq G$ and all conjugates of H is H itself, we denote $H \trianglelefteq G$. Note that this condition is also equivalent to $gH = Hg$ (as subsets) for any $g \in G$.

Definition 1.2.4 — quotient group. Let $H \trianglelefteq G$, then $\forall a, b \in G$, we define

$$aH \cdot bH := \{kl | k \in aH, l \in bH\} = abH$$

as subsets of G . This defines a group structure on G/H , called the **quotient group** or the **factor group** of G by H .

1.2.2 Some Technical Results

Proposition 1.2.1 Let H and K be subgroups of a group G . Define $HK = \{hk | h \in H, k \in K\}$. When G is finite, we have

$$|HK| = \frac{|H| \cdot |K|}{|H \cap K|}$$

Proof. to be written ■

The following lemmas tells when HK is a (normal) subgroup.

Lemma 1.2.2 Let H and K be subgroups of G . If $HK = KH$ as sets, then HK is a subgroup of G . In particular, if K is a normal subgroup, then $hK = Kh$ for any $h \in H$, and thus $HK = KH$ is a subgroup of G .

Proof. We need to verify that $\forall h_1 k_1 \cdot (h_2 k_2)^{-1} = h_1 k_1 k_2^{-1} h_2^{-1} \in HK$. Since $h_1(k_1 k_2^{-1}) \in HK = KH$, there exists h, k such that $h_1 k_1 k_2^{-1} = kh$. Then $kh_2^{-1} \in KH = HK$. ■

Lemma 1.2.3 If H, K are both normal subgroups of G , then HK is also a normal subgroup of G .

Proof. $\forall g \in G$, we have $gHK = HgK = HKg$. ■

1.2.3 homomorphism

Definition 1.2.5 — Kernel as a group homomorphism. For a homomorphism $\phi : G \rightarrow H$ of groups, the **kernel** is

$$\ker \phi = \{g \in G | \phi(g) = e_H\}$$

Lemma 1.2.4 Let $\phi : G \rightarrow H$ be a group homomorphism.

- (1) The image $\phi(G)$ is a subgroup of H .
- (2) The kernel $\ker \phi$ is a normal subgroup of G .

Proof. (1) It follows from that $\phi(g_1)\phi(g_2)^{-1} = \phi(g_1g_2^{-1}) \in \phi(G)$

(2) If $g_1, g_2 \in \ker \phi$, then

$$\phi(g_1g_2^{-1}) = e_H e_H^{-1} = e_H$$

For any $g' \in G$, and any $g \in \ker \phi$,

$$\phi(g'gg'^{-1}) = \phi(g')e_H\phi(g')^{-1} = e_H$$

■

Lemma 1.2.5 A homomorphism $\phi : G \rightarrow H$ of groups is injective if and only if $\ker \phi = \{e_G\}$.

1.3 isomorphism theorems, composition series, statement of Holder Theorem

1.3.1 isomorphism theorems

Theorem 1.3.1 — The first isomorphism theorem. If $\phi : G \rightarrow H$ is a homomorphism of groups, then $\ker \phi \trianglelefteq G$ and

$$G/\ker \phi \cong \phi(G)$$

Theorem 1.3.2 — The second homomorphism theorem. Let G be a group, and let $A \leq G$ be a subgroup and $B \trianglelefteq G$ a normal subgroup. Then AB is a subgroup of G , $B \trianglelefteq AB$, $A \cap B \trianglelefteq A$, and

$$AB/B \cong A/(A \cap B)$$

Proof. By lemma 1.2.2 we know AB is a subgroup of G .

For any $ab \in AB$, since B is normal to G , $abB = aB = Ba$ and $aB = aBb = Bab$. So $B \trianglelefteq AB$.

It is clear that $A \cap B \leq A$. For any $a \in A, x \in A \cap B$, we have $axa^{-1} \in B$, since B is normal. Also $axa^{-1} \in A$, since $x \in A$. So $A \cap B \trianglelefteq A$.

To show the isomorphism, we define $\phi : AB \rightarrow A/(A \cap B)$ by $\phi(ab) = a(A \cap B)$. It's easy to verify that ϕ is well-defined, surjective and a homomorphism, with $\ker \phi = B$. By Theorem 1.3.1, we know

the statement is true.

$$\begin{array}{ccc}
 AB & \xrightarrow{\phi} & A/(A \cap B) \\
 & \searrow q & \nearrow f \\
 & AB/B &
 \end{array}$$

■

Theorem 1.3.3 — The third isomorphism theorem. Let G be a group and H, K be normal subgroups with $H \leq K$. Then $K/H \trianglelefteq G/H$, and

$$(G/H)/(K/H) \cong G/K$$

Proof. Consider the map

$$\phi : G/H \longrightarrow G/K$$

$$gH \longmapsto gK$$

- ϕ is well-defined. We can simply redefine ϕ as $\phi(gH) = gH \cdot K = gK$ as product of subsets of G .
- ϕ is homomorphism. Easy to verify.
- ϕ is surjective.
- $\ker \phi = \{gH | gK = K\} = \{gH | g \in K\} = K/H$. So $K/H \trianglelefteq G/H$. And by the first isomorphism theorem, we statement holds.

■

Theorem 1.3.4 — The fourth isomorphism theorem/ Lattice isomorphism theorem. Let G be a group and $N \trianglelefteq G$. Then there is a bijection

$$\{\text{subgroups of } G \text{ containing } N\} \longleftrightarrow \{\text{subgroups of } G/N\}$$

$$A \longmapsto A/N$$

$$\pi^{-1}(\bar{A}) \longleftarrow \bar{A}$$

where $\pi : G \rightarrow G/N$ is the natural projection.

This bijection preserves

- inclusion of groups
- intersections
- normality of subgroups
- quotients of subgroups

Visually, we have: Lattice of subgroups of G containing $N \iff$ Lattice of subgroups of G/N .

1.4 Lattice

Definition 1.4.1 Let (S, \leq) be a set equipped with a partial order. (S, \leq) is called a *Lattice* if any $x, y \in S, \{x, y\}$ has a maximal lower bound and a minimal upper bound. The lower bound is denoted by $x \wedge y$, while the upper bound is denoted by $x \vee y$.

■ **Example 1.1** 设 n 为正整数, A_n 为 n 的所有正因数的几何, 则 A_n 关于整除关系构成格。

■

■ **Example 1.2** 设 $P(B)$ 为 B 的幂集, 则 $P(B)$ 关于包含关系 \subseteq 构成格, 称为幂集格。 ■

■ **Example 1.3** — 子群格. 群 G 的所有子群, 关于包含关系。 ■

1.5 composition series, Jordan-Holder Theorem, simplicity of A_n , direct product groups

Definition 1.5.1 — composition series. In a group G , a series of subgroups

$$\{0\} = N_0 \leq N_1 \leq \dots \leq N_k = G$$

such that $N_{i-1} \trianglelefteq N_i$ and N_i/N_{i-1} is a simple group for $1 \leq i \leq k$ is called **composition series**. In this case, N_i/N_{i-1} is called a **composition factor**.

Definition 1.5.2 — solvable. A group G is called **solvable** if there exists a composition series

$$\{0\} = N_0 \leq N_1 \leq \dots \leq N_k = G$$

such that N_i/N_{i-1} is abelian.

Corollary 1.5.1 a finite group is solvable if and only if all the composition factors are \mathbf{Z}_p .

Theorem 1.5.2 — Jordan-Holder. Let G be a non-trivial group,

(1) G has a composition series.

(2) Assume that a group G has the following two composition series,

$$\{0\} = A_0 \leq A_1 \leq \dots \leq A_m = G, \quad \{0\} = B_0 \leq B_1 \leq \dots \leq B_n = G$$

then $m = n$ and there exists a bijection $\sigma : \{1, 2, \dots, m\} \rightarrow \{1, 2, \dots, n\}$

$$A_{\sigma(i)}/A_{\sigma(i-1)} \cong B_i/B_{i-1}$$

for $i = 1, 2, \dots, m$

Proof. to be written

1.5.1 The simplicity of $A_n, n \geq 5$

Proposition 1.5.3

2. Rings and Ideals

If not pointed out specifically, the notion "ring" refers to a commutative ring with an identity element.

2.1 rings, ideals, quotient rings

Definition 2.1.1 — ring homomorphism. Let A, B be rings, $f : A \rightarrow B$ is a homomorphism when

(1) $f(x+y) = f(x) + f(y)$. So f is a homomorphism of abelian groups.

(2) $f(xy) = f(x)f(y)$, $f(1) = 1$. So f is a homomorphism between the monoids (A, \cdot) and (B, \cdot) .

Definition 2.1.2 — ideal of a ring. An ideal I of a ring A is an additive subgroup and is such that $AI \subseteq I$.

■ **Example 2.1** Every ring A has 2 trivial ideals: $\{0\}$ and A . ■

Below, I denotes the ideal of ring A .

Definition 2.1.3 — quotient ring. Define multiplication in the quotient group A/I by

$$(a+I) \cdot (b+I) = ab+I$$

It is well defined. Now A/I is made into a ring called the *quotient ring*. The mapping $\phi : A \rightarrow A/I$ which maps each $x \in A$ to its coset $x+I$ is a surjective ring homomorphism.

Proposition 2.1.1 There is a one-to-one order preserving correspondence between

$$\{J | I \subseteq J \subseteq A, J : \text{ideal}\} \xleftarrow{1:1} \{\bar{J} | \text{ideal } \bar{J} \subseteq A/I\}$$

$$J \longmapsto J+I$$

$$\phi^{-1}(\bar{J}) \longleftarrow \bar{J}$$

Proof. First, Let's show that $J + I$ is an ideal in A/I .

$J + I$ is abelian : trivial; $\forall x + I \in A/I, (x + I) \cdot (J + I) = (Jx + I) \subseteq (J + I)$, since J is an ideal.

Second, we can verify this mapping to be invertible. ■

Corollary 2.1.2 If $f : A \rightarrow B$ is any ring homomorphism, the *kernel* of $f (= f^{-1}(0))$ is an ideal of A , and the image of $f (= f(A))$ is a subring C of B , but may not be an ideal.

Proof. Consider the embedding mapping

$$\mathbb{Q} \longleftrightarrow \mathbb{Q}[X]$$

The image is absolutely not an ideal. ■

Theorem 2.1.3 — fundamental homomorphism theorem. $f : A \rightarrow B$ is a ring homomorphism, I is the kernel of f , $g(a+I) := f(a)$ then g is a ring isomorphism.

$$\begin{array}{ccccc} A & \xrightarrow{f} & \text{Im}(f) & \hookrightarrow & B \\ & \searrow \phi & \uparrow g & & \\ & & A/I & & \end{array}$$

2.2 zero-divisors, nilpotent elements, units

Definition 2.2.1 — zero-divisor. a zero-divisor in a ring A is an element x for which there exists $y \neq 0$ in A such that $xy = 0$

Definition 2.2.2 — integral domain. a ring with no zero-divisors $\neq 0$ and not a zero ring.

Definition 2.2.3 — nilpotent. An element $x \in A$ is *nilpotent* if $x^n = 0$ for some $n > 0$.

(R) A nilpotent element is a zero-divisor.

Definition 2.2.4 — unit 可逆元. A unit in A is an element x such that $xy = 1$ for some $y \in A$. Note that y is uniquely determined by x , and is written as x^{-1} .

(R) The units in A form a abelian group under multiplication.

Definition 2.2.5 — field. A field is a ring A which $1 \neq 0$ and every non-zero elem. is a unit.

Proposition 2.2.1 Let A be a ring $\neq 0$. The following are equivalent:

- (1) A is a field;
- (2) The only ideals in A are 0 and (1) ;
- (3) Every non-trivial homomorphism of A into a non-zero ring B is injective.

2.3 prime ideals and maximal ideals

Definition 2.3.1 — prime ideal. An ideal \mathfrak{p} in A is *prime* if $\mathfrak{p} \neq (1)$ and if $xy \in \mathfrak{p} \implies x \in \mathfrak{p}$ or $y \in \mathfrak{p}$

Definition 2.3.2 — maximal ideal. An ideal \mathfrak{m} in A is *maximal* if $\mathfrak{m} \neq (1)$ and if there is no ideal α such that $\mathfrak{m} \subset \alpha \subset (1)$ (strict inclusion).

(R) \mathfrak{m} can be $\{0\}$.

Proposition 2.3.1 \mathfrak{p} is prime $\iff A/\mathfrak{p}$ is an integral domain.

Proof. Easy to verify. ■

Proposition 2.3.2 \mathfrak{m} is maximal $\iff A/\mathfrak{m}$ is a field. Hence, a maximal ideal is prime.

Proof. By Proposition 2.1.1 and Proposition 2.2.1, the statement holds. ■

Proposition 2.3.3 If $f : A \rightarrow B$ is a ring homomorphism and q is a prime ideal of B , then $f^{-1}(q)$ is a prime ideal in A .

Proof. If $a, b \in A$ such that $f(a) = f(b) \in q$. Then $f(a - b) = f(a) - f(b) \in q$. Thus, $f^{-1}(q)$ is abelian. For any $a \in f^{-1}(q), x \in A$, we have $f(ax) = f(a)f(x) \in Bq = q$. Thus, $f^{-1}(q)$ is an ideal. For any $a, b \in A, ab \in f^{-1}(q) \iff f(ab) \in q \iff f(a) \cdot f(b) \in q \iff f(a) \in q \vee f(b) \in q \iff a \in f^{-1}(q) \vee b \in f^{-1}(q) \iff f^{-1}(q)$ is a prime ideal. ■

(R) If m is a maximal ideal of B , it is not necessarily true that $f^{-1}(m)$ is maximal in A . Consider $A = \mathbb{Z}, B = \mathbb{Q}, m = \{0\}$.

Theorem 2.3.4 Every ring $A \neq 0$ has at least one maximal ideal.

This theorem relies on Zorn's Lemma. We first introduce it.

Definition 2.3.3 — chain in a partially ordered set. Let S be a non-empty partially ordered set. A subset T of S is a chain if either $x \leq y$ or $y \leq x$ for every pair of elements in T .

Lemma 2.3.5 — Zorn. If every chain T of S has an upper bound in S , then S has at least one maximal element. Zorn's Lemma is equivalent to the axiom of choice.

Proof. Let's prove theorem 2.3.4, using Zorn's Lemma.

Let $\Sigma = \{I : I \text{ is ideal}, I \neq (1)\}$. Order Σ by inclusion. Σ is not empty, since $0 \in \Sigma$. For each chain, consider the union as another ideal $\neq (1)$ to be an upper bound. Then Zorn's lemma yields that there is a maximal element. ■

(R) If A is Noetherian, we can avoid the use of Zorn's lemma.

Corollary 2.3.6 If $a \neq (1)$ is an ideal of A , there exists a maximal ideal of A containing a .

Proof. Replace Σ by $\{I : I \text{ is ideal containing } a, I \neq (1)\}$ in the proof of Theorem 2.3.4 . ■

Corollary 2.3.7 Every non-unit of A is contained in a maximal ideal.

Definition 2.3.4 — local ring, residue field. If a ring A has exactly one maximal ideal m (e.g. fields), then A is called a *local ring*. The field $k = A/m$ is called the residue field of A .

Proposition 2.3.8 Let A be a ring and $m \neq (1)$ an ideal of A such that $\forall x \in A - m$ is a unit in A . Then A is a local ring and m its maximal ideal.

First, we observe the following

Lemma 2.3.9 Every element in a maximal ideal is not a unit.

proof of Proposition 2.3.8. From corollary 2.3.6 and lemma 2.3.9 we know m is a maximal ideal. Also from lemma 2.3.9, we know there doesn't exist other maximal ideals. Thus, A is a local ring. ■

Proposition 2.3.10 Let A be a ring and m a maximal ideal, such that every element of $1 + m$ is a unit in A . Then A is a local ring.

Proof. Make an analogy to Bezout Theorem. Let $x \in A - m$. Since m is maximal, the ideal generated by x and m is (1) , hence there exists $y \in A, t \in m$ such that $xy + t = 1$. Thus $xy = 1 - t \in 1 + m$, which means x is a unit. ■

■ **Example 2.2** $A = F[X_1, \dots, X_n], F : \text{field}$. Let $f \in A$ be an irreducible polynomial. By unique factorization, the ideal (f) is prime. When $n \geq 2$, it's not a *principal ideal domain*. ■

■ **Example 2.3** Every ideal in \mathbf{Z} is of the form (m) for some $m \geq 0$. The ideal is prime $\iff m = 0$ or is a prime number. For all ideals (p) are maximal. ■

Definition 2.3.5 — principal integral domain. an integral domain where every ideal is principal.

Proposition 2.3.11 Every non-zero prime ideal is maximal.

Hint. The cancellation law applies in the integral domain. ■

2.4 nilradical and Jacobson radical

Proposition 2.4.1 The set \mathfrak{R} of all nilpotent elements in a ring A is an ideal, and A/\mathfrak{R} has no nilpotent element $\neq 0$.

Proof. For any $x, y \in \mathfrak{R}$, there exists $n \geq 0$ such that, $(x - y)^n = 0$. Thus, $x - y \in \mathfrak{R}$ and \mathfrak{R} is abelian group. It's easy to show that \mathfrak{R} is an ideal. If there exists $a \in A$, such that $\exists n > 0, (a + \mathfrak{R})^n = 0 = a^n + \mathfrak{R}$, then $a \in \mathfrak{R}$. Hence, A/\mathfrak{R} has no non-zero nilpotent element. ■

The ideal \mathfrak{R} is called the *nilradical* of A .

Proposition 2.4.2 The nilradical of A is the intersection of all the prime ideals of A .

Proof. We observe that every nilpotent element belongs to any prime ideal. Hence, $\mathfrak{R} \subseteq \bigcap_{p: \text{prime ideal } p}$. On the other side, for each element within the intersection of all prime ideals, 试图用Zorn's lemma 寻找一个极大理想, 证明这也是一个prime ideal. 从而non-nilpotent element不属于这个ideal. ■

Definition 2.4.1 — Jacobson radical. The Jacobson radical \mathfrak{R} of A is defined to be the intersection of all the maximal ideals of A .

It can be characterized as

Proposition 2.4.3 $x \in \mathfrak{R} \iff 1 - xy$ is a unit for all $y \in A$.

Proof. \implies : Suppose $1 - xy$ is not a unit. By corollary 2.3.7 it belongs to some maximal ideal m . But $x \in \mathfrak{R} \subseteq m$, hence $xy \in m$ and $1 \in m$, which is absurd.

\impliedby : 考虑Bezout定理。If $x \notin m$ for some maximal ideal m , then $m + (x)$ generate the unit ideal (1) , so that $u + xy = 1$ for some $u \in m, y \in A$. Hence $1 - xy \in m$ is not a unit. ■

2.5 operations on ideals

3. Module Theory
